Experiment No: 06

Experiment Name: Switching an interface to move a host around a network using mininet.

Objectives:

Mininet enables us to create, interact with, customize and share a software defined network prototype quickly and easily. It also provides a smooth path to run on hardware. From this lab we will learn:

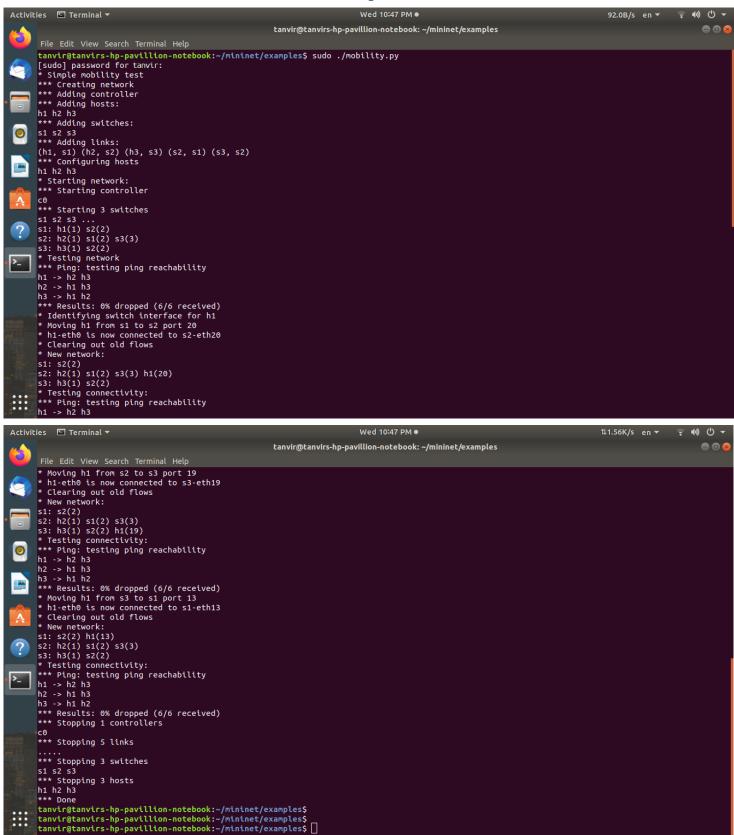

- ➤ How to install mininet and use it properly
- ➤ How to prototype a large network on a single machine by mininet

Source Code:

```
from mininet.net import Mininet
                                                           del self.nameToIntf[ intf.name ]
from mininet.node import OVSSwitch
from mininet.topo import LinearTopo
                                                         def addIntf( self, intf, rename=False,

```

Output:

Discussion:

In this lab experiment, simple mobility test by mininet in Linux (Ubuntu) platform was performed. Here, h1 h2 h3 were hosts and s1 s2 s3 were switches. We moved a host from s1 to s2, s2 to s3, and then back to s1. Thus simple mobility test among the hosts was checked successfully.
